Takahashi N., Ishihara H., Mori M., Tejima S.;
"Structural analyses of asparagine-linked oligosaccharides of porcine
pancreatic kallikrain.";
Biochemistry 27:7146-7154(1988)
-!- FUNCTION: Glandular kallikreins cleave Met-Lys and Arg-Ser bonds
in kininogen to release Lys-bradykinin.
-!- CATIVITY: Preferential Cleavage of Arg-|-Xaa bonds in
small molecule substrates. Highly selective action to release
kallidin (1ysyl-bradykinin) from kininogen involves hydrolysis of
Met-|-Xaa.
                                                                                                                                                                                                                            SIMILARITY: Contains 1 peptidase S1 domain.
CAUTION: Native porcine kallikrein is a monomer. Chains of the pancreatic beta-kallikrein are heterogeneous artifacts of proteolytic degradation during isolation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          InterPro; IPR001254; Peptidase_S1_S6.

Application US/08944483

Sequence 33. Application US/08944483

Patent No. 623456

GENERAL INFORMATION:

APPLICANT: COLPITYS, TRACEY L.

APPLICANT: GRADMADOS, EDWARD N.

APPLICANT: RUSSELL, JOHN C.

APPLICANT: STRONES, MICHAEL R.

APPLICANT: STRONES, STEVEN D.

TITLE OF INVENTION: NOVEL SERINE PROTEASE REAGENTS

TITLE OF INVENTION: OF THE PROSTATE

NUMBER OF SEQUENCES: 76

NUMBER OF SEQUENCES: 76

CORRESPONDENCE ADDRESS:

NUMBER OF SEQUENCES: 76

Application US/09261416A
Sequence 7. Application US/09261416A
Sequence 7. Application US/09261416A
GENERAL INFORMATION:
APPLICANT: Underwood, Lowell J.
TITLE OF INVENTION: TADG-12: A No. 6291663el Transmembrane Serine Protease;
FILLE REFERENCE: Dels 2
CURRENT APPLICATION NUMBER: US/09/261,416A
CURRENT PILING DATE: 1999-03-03
NUMBER OF SEQ ID NOS: 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              OTHER INFORMATION: Serine protease catalytic domain of stratum corneum OTHER INFORMATION: chymotryptic enzyme (Scce) homologous to similar OTHER INFORMATION: domain in TADG-12

; Patent No. 5981256
; GENERAL INFORMATION:
    APPLICANT: Egelrud, Torbjorn
    APPLICANT: Bellrud, Torbjorn
    APPLICANT: Brown Combinant Stratum Corneum Chymotryptic
    TITLE OF INVENTION: Enzyme (SCCE)
    TITLE OF INVENTION: Enzyme (SCCE)
    TITLE OF SEQUENCES: 17
    CORRESPONDENCE ADDRESS:
    ADDRESSEE: White & Case, Patent Department
    STREET: 1155 Avenue of the Americas
    CITY: New York
    COUNTRY: U.S.A.
    ZIP: 10036-2787
    COMPUTER READABLE FORM:
    MEDIUM TYPE: Floppy disk
    COMPUTER: IBH PC compatible
    OPERATING SYSTEM: PC-DOS/MS-DOS
    SOFTWARE: PatentIn Release #1.0, Version #1.25 (EPO)
    CUBRENTION UNBER: US/09/154,344

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                              March 11, 2006, 01:27:17 ; Search time 8 Seconds

Diagnosing cancer comprises detecting stratum corneum chymotrypsin enzyme

Claim 25; Page 103; 127pp; English.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCB). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide

The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or peptides are also useful in the monitoring and development of immunotherapies for ovarian and other malignancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.
                                                                                                                                                                                                                                               Human stratum corneum chymotrytic enzyme peptide fragment SEQ ID NO:35.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method for vaccinating an individual

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed can disconstitute of (II) as useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in somethodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating cupplement. (II) and (II) and (II) are useful for treating disorders in volving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in dispinance of sequences. Abg00010-Abg30377 represent novel human diagnostic amino acid sequences. Abg00010-Abg30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in account of parts of the invention are appeared in the printed specification, but was obtained in a constant of the constant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a Novx protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an antibody that immunospecifically compressed associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for a modulator different in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for a babove; (10) a method for identifying a potential therapeutic agent for a battant physical interactions of the polypeptide described above; (13) a method of activity or of activity or of altency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating or a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating or pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide; Novyx sequences have antidabetic, anorectic, antibacterial, virucide, immunomodulator, cytostatic, nocropic, neuroprotective, antiparkinsonian antilipaemic activities, and can be used in gene therapy. The collapores such as diabetes or obesity, infections, cachexia, and cancer, and antilipaemic activities, and can be used in gene therapy. The syndrome associated with a human disease. The polypeptide or the nucleic addisorders such as diabetes or obesity, infections, cachexia, and cancer collaporates and as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoletic disorders such as Alzheimer's disease or Parkins

The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the abberrant expression and activity of NOVX by supplementing the patient our polypeptides and carivity of NOVX by supplementing the patient our control of the activity of NOVX by supplementing the patient our control of the activity of NOVX by supplementing the patient our control of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by confidential with the cells own genes and preventing their expression. NOVX polymelecules and complementary sequences may also be used as DNA production of antibodies and so which patients may be in need of similar sequences in assays to detect and quantitate the presence of similar sequences in assays to detect and quantitate the presence of similar sequences in assays to detect and antiquity of NOVX. The crestorative therapy. NOVX polypeptides may also be used as antidens and antiquity of NOVX. The anti-NOVX polypeptide and in assays to identify modulators candiance NOVX polypeptide expression and activity of NOVX. The canti-NOVX polypeptide expression and activity of NOVX colypeptides. The anti-NOVX polypeptide antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX colypeptides and polymucleotides may be used in this way to prevent, and acceptance and treat: metat: metating disorders, diagnose and treat: metating disorders, diagnose and treat: metating disorders, diagnose and treat: metating disorders, diaberes, observed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disease, anorexia, cancer, cancer-associated cachexia, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, haematopoletic disorders, and the various dyslipidaemias, metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human, NOVX; antidiabetic; anorectic; antibacterial; virucide; immunomodulator; cytostatic; nootropic; neuroprotective; antipaemic; gene therapy; human disease; metabolic disorder; diabetes; obesity; infection; cachexia; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoletic disorder; dyslipidaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or

Claim 1; Page 169-170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising a polypeptide described above; in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above correctly altered levels of expression of the above correctly an encloded a disease associated with altered levels of expression of the above correctly of interesting an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiclogical interactions of the polypeptide described above; (10) a method for addulator of activity or of latency or predisposition to correctening for a modulator of activity or of latency or predisposition to the activity of the polypeptide described above; (12) methods of modulator or preventing a pathology associated with the polypeptide; (12) method for modulating the activity or of latency or predisposition to correct a partology associated with the above polypeptide in a method for producing the above polypeptide in a method for producing the above polypeptide in a crivity of the polypeptide above; (13) methods of correctly infections, captoratic, anoretic, antibacterial, virucide, and antilipaemic activities, and can be used in gene therapy. The colypeptide is useful in manufacturing a medicament for treating a cyndrone associated with a human disease. The polypeptide or the nucleic acid molecule may be used to disease. The protections, cacid molecule may be used to disease. The protecti

The invention relates to isolated Novy polypetices and polymucleotides. Novy polypetides and polymucleotides to the invention relates to isolated Novy polypetides and activity of Novy polypetides and activity of Novy polypetides and cativity of Novy polypetides and activity of Novy polypetides and polymucleotides may be used to treat disorders associated with decreased coxpression or activity of Novy by supplementing the patient our coxplaint of Novy bolypetides and production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of Novy polypeptides by binding with the cells own genes and preventing their expression. Novy colymuclectides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and in assays to identify modulators (agonists and antibodies and in assays to identify modulators cantivovy polypeptide antibodies, agonists and antagonists may also be used as diagnostic agents for detecting the presence of NoVx in samples. NoVx polypeptides and polymucleotide may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, and the various dyslipidaemias, metabolic disorders, and the metabolic syndrome X and the Anderson and the metabolic syndrome X and and activity the metabolic syndrome X and Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X;

                                                                                                                                                                                                                                                                                                                                                   Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic partic. AV-120 host cells. It is used to develop products for the design and testing of cods. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneuw chymotryptic enzyme (SCCE) or its variant, or stratum corneuw chymotryptic enzyme (SCCE) or its variant, or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a cosmetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be useful for screening or identifying a composation effective for the prevention or treatment of an abnormal or composation effective for the prevention or treatment of an abnormal or composition effective for the prevention or treatment of an approxant or composition effective for the prevention or treatment of an approxant or composition effective for the prevention or treatment of an approxant or composition effective for the prevention or treatment of an approxant or printitus, atopic dermatitis, eccena, acne and inherited skin diseases of inflammatory skin diseases selected from diseases consisting of epidermal hyperkratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the N-terminal Erragment of the human statatum corneum chymotryptic enzyme, SCCE synonymous with human kallikrein 7 (KLK7), used in the development of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SCCE; human; stratum corneum chymotryptic enzyme; kallikrein 7; serine proteease; transgenic mammal; skin; skin disease; skin cancer; hyperkeratosis; acanthosis; epidermal inflammation; dermal inflammation; pruritus; atopic dermatitis; eczema; acne; itch; KLK7; enzyme.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a bratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a cosmetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an ecomposition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hyperkeratosis, acanthosis, epidermal inflammation, dermal inflammation, puritus, atopic dermatitis, eczema, acne and inherited skin diseases with epidermal hyperkeratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the human stratum corneum chymotryptic enzyme, SCCE which is a serine protease synonymous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; protease; cancer; immune-related disorder; cardiovascular disease; neuronal-associated disease; metabolic disorder; inflammatory disorder; nervous system disorder; sexual dysfunction; pain; mood disorder;
                                                                                                                                                                                                                                                                                                                                                                                            Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CCE which is a serine protease synonymous and is used in the development of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention relates to the isolation of novel human proteases, and the mucleic acids encoding them. The sequences of the invention are condition that the mucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. restenosis and diseases and asthma), cardiovascular diseases (e.g. restenosis and coronary thrombosis), brain or neuronal-associated diseases, metabolic disorders (e.g. disbettes, obscitzy), inflammatory disorders (e.g. disbettes, pain, sexual dysfunction, mood disorders, attention disorders, pain, sexual dysfunction, mood disorders, attention disorders, hypotension, psychotic disorders, neurological disorders (e.g. Alzheimer's disease, Parkinson's disease) and dyskinesias. The nucleic acids and polypeptides are also useful for treating viral infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. inflammatormal disease (e.g. infections aused as ocular disease (e.g. inflammatormal disease) the novel human proteases of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention describes genes (1) which are differentially regulated in prostate cancer. (2) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (1) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves determining the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels of at least 10 genes are determined. (1) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells which involves contacting a polypeptide differentially-regulated in prostate cancer. (2) is also useful as moleculate a biological activity of the polypeptide, and certifies a molecular markers, as qualt trader of the polypeptide, and determining whether the test agent modulates the biological activity. (1) is useful as molecular markers, as qualt traders, prognosticating, determining predisposition to diseases and conditions especially relating to prostate cancer. (1) and its expression products are used in the diagnostic test to assay for presence of cancer e.g., in tissue sections, in biopsy sample, in total NN, in lymph, in blood etc. (1) is useful for assessing assessing the polypeptide and thus to blood etc. (1) is useful for assessing as target for thersapy or drug discovery. (1) can also be used for expressing the polypeptide and thus for searching specific binding partners of the polypeptide and these completed and disease pathways and the delineation of targets in these graders and groups of genes, expressed in pathways and the delineation of targets in these completed and disease pathways and the delineation of a product or animal or an early an early program o
                                                                                                                                                                                                                                                                                                                                                                           Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; Page 293-294; 416pp; English.

(ORIG-) ORIGENE TECHNOLOGIES INC.

ö Jay Sun Z, WPI; 2003-058520/05. N-PSDB; ABX10375. Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

Claim 1; Page 351; 416pp; English.

The invention describes genes (1) which are differentially regulated in prostate cancer. (1) Is useful for diagnosing a prostate cancer in a comprising protate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (1) Is useful for assessing a therapeutic or preventive incremention in a subject having a prostate cancer, which involves contention in a subject having a prostate cancer, which involves the expression levels in a sample comprising prostate cancer. (2) Is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells, which involves contacting a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent under conditions effective for the test agent to modulate a biological activity. (1) is useful as molecular markers, as drug targets, and for detecting, cancer cells, withing or prostate cancer. (1) and its expression conditions especially retaining predisposition to diseases and conditions especially retaining to prostate cancer. (1) and its expression conditions especially relating to prostate cancer. (1) and its expression conditions especially relating predisposition to diseases and conditions especially relating partners of the polypeptide and thus for easewing specific genes, and genes, expression conditions especially relating partners of the polypeptide and development, the nature of geneic defect, etc. (2) is useful for assessing cancer e.g., to determine the type conditions in the propertions to be used for expressing the polypeptide and development to prostate cancer. The identification of specific genes, and groups of genes, expressed in pathways which are useful in disease pathways and the delineations. This i

The invention relates to a novel isolated polynucleotide. The polynucleotides of the invention have cytostatic activity, and may have a use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide and polypeptide useful for diagnosing and/or treating cancer, particularly ovarian cancer, and as a vaccine.
                                                                                                                                                                                            Human stratum corneum chymotryptic enzyme - ovarian cancer clone O1676P.

My protoporphyrin methyl transferase [imported] - Rubrivivax gelatinosus C.Species: Rubrivivax gelatinosus R.J. 10004
C.Accession: T50904
R.Nagashima, K.V.; Igarashi, N.; Harada, J.; Nagashima, S.; Matsuura, K.; Shimada, K. submitted to the EMBL Data Library, November 1999
A.Description: Defermination of Nucleotide Sequences of Rubrivivax gelatinosus Photosynth A.Peference number: Z25270
A.Accession: T50904
A.Status: preliminary; translated from GB/EMBL/DDBJ
A.Molecule type: DNA
A.Fesidues: 1-1236 -NAG-
A.Fesidues: 1-1236 -NAG-
A.Fesidues: J.L.SA -NAG-
A.Fesidues: UNIPROT: 09JPA4; UNIPARC: UPI00000B2528; EMBL: AB034704; PIDN: BAA94057.]
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cispecies: Pyrococcus abyssi

Biochem, Biophys. Res. Commun. 211:586-589(1995).

-!- FUNCTION: May catalyze the degradation of intercellular cohesive structures in the cornified layer of the skin in the continuous shedding of cells from the skin surface. Specific for amino acid residues with aromatic side chains in the PI position. SCCE cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammatory cytokines.

TISOIG SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Also expressed in the brain, mammary gland, cerebellum, spinal cord and kidney. Lower levels in salivary gland, uterus, thymus, thyroid, placenta, traches and testis. Up-regulated in ovarian carcinoma, especially late-stage serous carcinoma, compared with normal ovaries and benign adenomas (at the protein level).

Coll INDUCTION: By estrogens and glucocorticoids in a breast carcinoma
SUBCELLULAR LOCATION: Secreted. In ovarian carcinoma, secreted and also observed at the apical membrane and in cytoplasm at the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            // similarity).

Inhibina and activins inhibits and activate,
respectively, the secretion of follitropin by the pituitary gland.
Inhibins/activins are involved in regulating a number of diverse functions such as hypothalamic and pituitary hormone secretion, gonadal hormone secretion, agem cell development and maturation, erythroid differentiation, insulin secretion, nerve cell survival, embryonic axial development or bone growth, depending on their subunit composition. Inhibins appear to oppose the functions of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBUNIT: Dimeric, linked by one or more disulfide bonds. Inhibin A is a dimer of alpha and beta-A. Inhibin B is a dimer of alpha and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FTM: Proteolytic processing yields a number of bioactive forms, consisting either solely of the mature alpha chain, of the most Neterninal propeptide linked through a disulfide bond to the mature alpha chain, or of the entire proprotein. SIMILARITY: Belongs to the TGF-beta family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WCLEOTIDE SEQUENCE.
